Github Favorite App

Artwork/Project Description

Github Favorite App is an Android apps that uses the Github API which provide the user to search the github users, view their profiles, and assign them to favorites whose the data is stored in local storage. This project is one of the submissions in the Belajar Fundamental Aplikasi Android course at Dicoding Indonesia which became my first project in building an Android apps by integrating APIs and databases into the apps. I made this project from scratch until it can be used by myself and I got 4/5 stars for this submssion rating.

[Dicoding Story](#)

Artwork/Project Description

Dicoding Story is an Android apps that uses a Private API from Dicoding with user login authentication where users can upload a stories (with pictures and text) that can be seen also by other users. In addition, this application also has a Google Maps API that users can use to add stories along with their current location. Each user can also see the created story along with its location. This project is one of the submissions in the Belajar Pengembangan Aplikasi Android Intermediate course at Dicoding Indonesia which became my first project in building an Android apps by Google’s APIs from Google Cloud into the apps. I made this project from scratch until it can be used by myself and I got 4/5 stars for this submssion rating.

Artwork/Project Description

Selidik Pasar a.k.a. Selasar is an Android apps that provides information on food commodities prices to monitor price changes that occur in traditional markets. In addition, users can also view news or article related to why food commodities prices can be changes. To make it easier, we summarized the news into a ML model using the library from TensorFlow. Which this model will be managed as a Private API to display on Android apps. And of course this apps uses a Private API that was built using AppEngine from Google Cloud Platform. This project is my final project in Bangkit Academy which became my first project in building an Android apps as a Team with combining Machine Learning Team and Cloud Computing Team.
